System(Parallel)

Supervised by:

Dr.E/ Farouq Al-fuhidy

E/ Abdullah Al-maswary

Introduction

Electricity and technology are two sides of the same coin, and with the development of technology, there were the most important factors for its development and making life easier and more advanced.

The most important of these factors is logical design.

Digital logic is the conceptual language behind modern computer systems. It uses the Boolean language, which consists of a system of rules that essentially says “yes” or “no” to a series of questions, leading to extremely complicated decisions.

The aim of logical design is to construct a relational schema that correctly and efficiently represents all of the information described by an Entity-Relationship schema produced during the conceptual design phase.

Tools:

1-Hardware

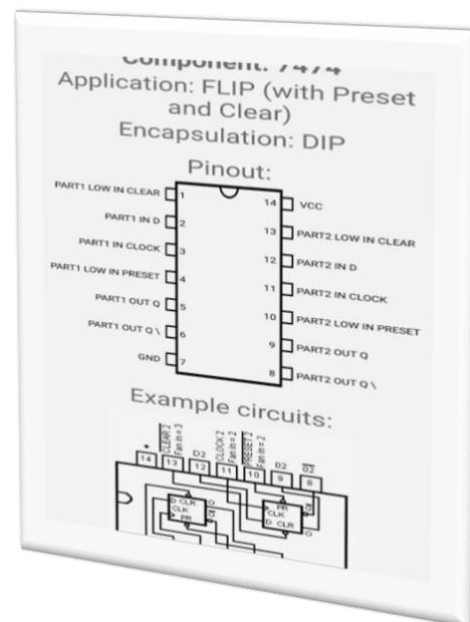

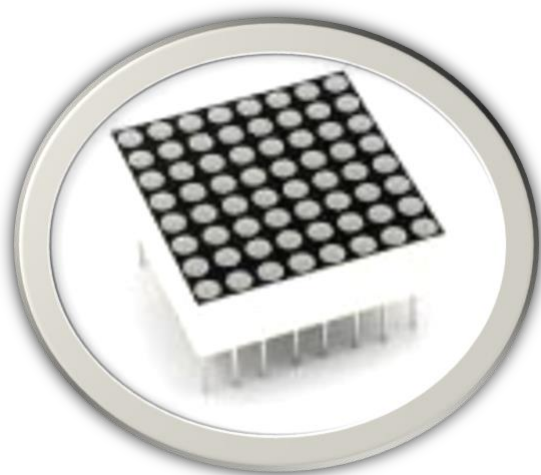

Flip flop 7474

Led Matrix

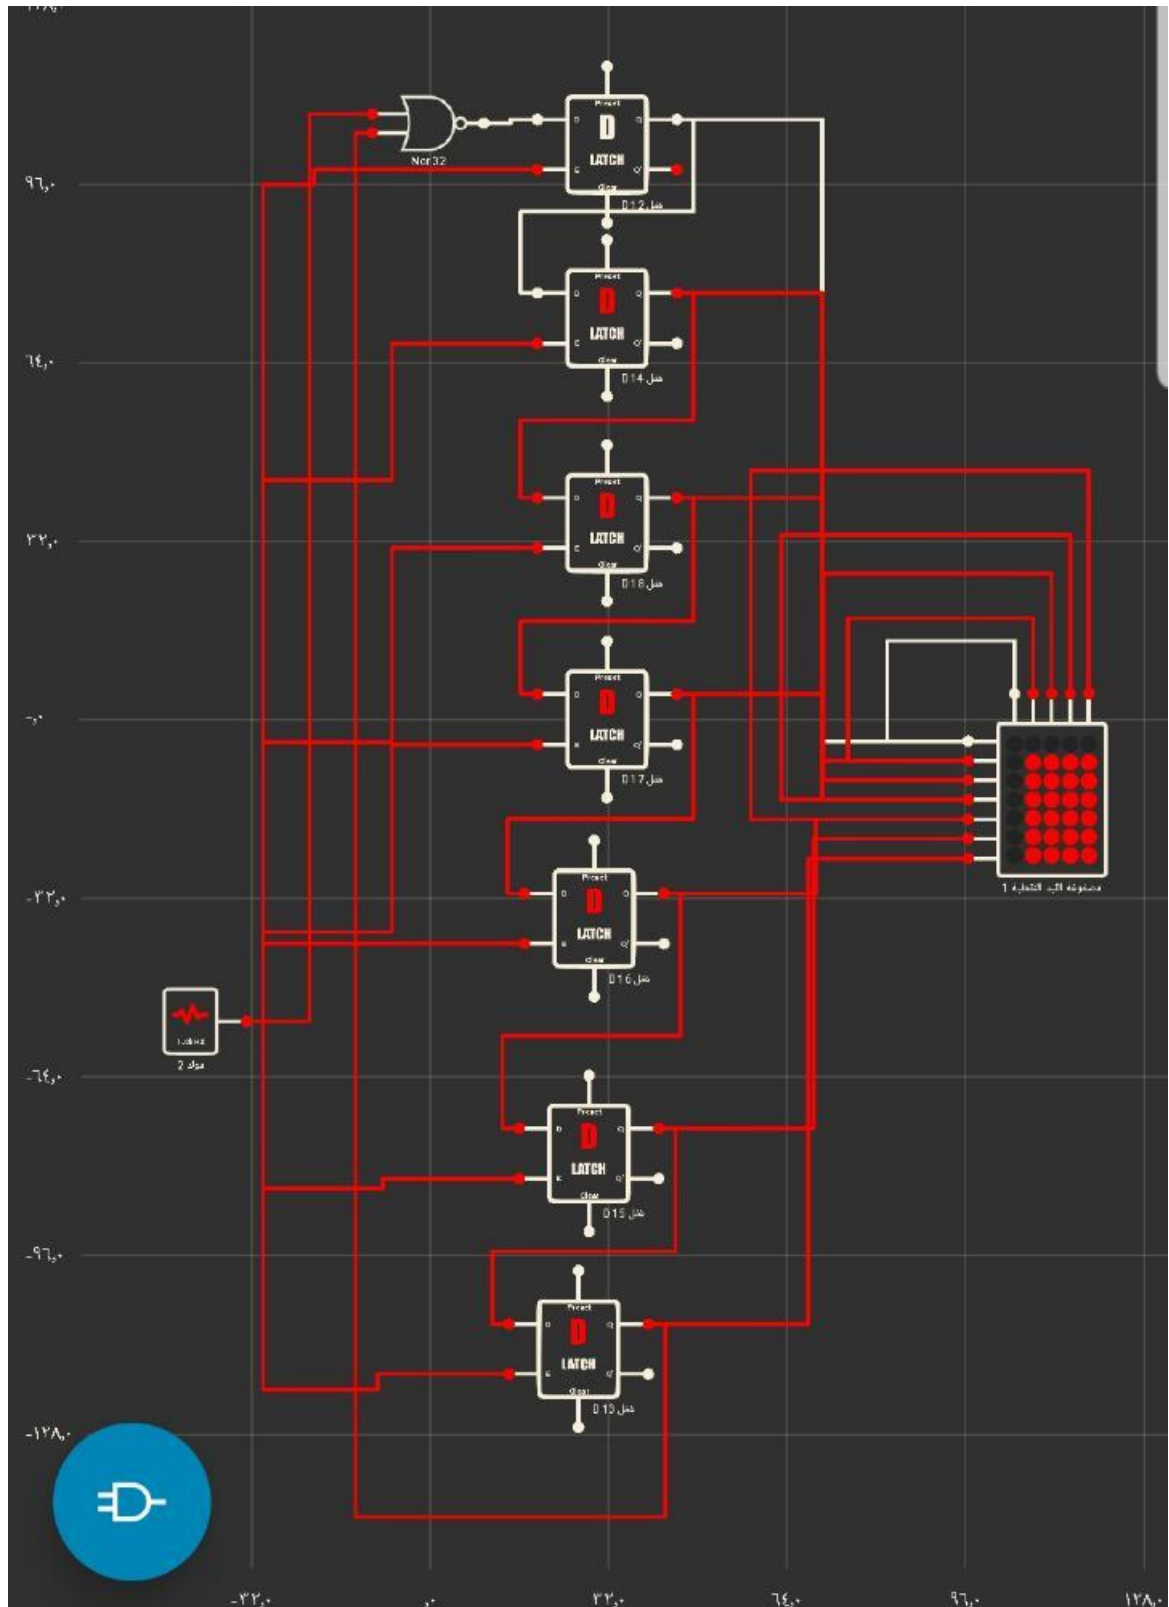

1Hz generator

Bed board

Connecting wires

2-Software

Discussion:

LED matrix or LED display is a large, low-resolution form of dot-matrix display, useful both for industrial and commercial information displays as well as for hobbyist human-machine interfaces.

One of its uses is to display numbers or shapes to be displayed on the screen by .giving it some instructions

Conclusion

.That's all, good luck

I wish you good luck.
